[STOPP ammonia follow up.doc](#)

The ADEQ modeling doesn't show the school, but it is three miles west of the 500PPM spot, where the level is "just" 250PPM or so. I had to use a mapping program to figure it out. Also, I have driven to the school a couple of times now. Attached is the letter of concern we sent out after I attended an air permit hearing at the school in late October 2015. I have had ammonia safety training because I was an LEPC member for ten years.

Hi Steve – Thanks for sharing this. Where is the school on the maps? I don't see it identified.

-Ben

ps – I have both a CDC and and EPA email address because ATSDR's region 9 office is co-located with EPA region 9 (so we use their email system). But, as you probably know, I'm not an EPA employee...

The ADEQ report states the nearest residential community near Tonopah is 1.2 km to the east, which is a stunner for the many people who live across the street and otherwise adjacent to the facility.
